Lab 4 VibeCoding — Chat History

Project: Rock Paper Scissors — Adaptive Duel

Prepared transcript of the project-related conversation in this chat. This document summarizes the visible exchanges for submission support; it is not an official ChatGPT data export.

User

Shared the GitHub project https://github.com/SETAPESU26/59_rock_paper_scissor and uploaded Lab_4_VibeCoding_Student_handout.pdf and SE-LAB-main.zip. Asked to complete the required tasks and provide completed documents/PDFs.

Assistant

Explained that the Lab 4 handout requires fixing the Python game, implementing features listed in the repository README, recording 10-second before-and-after videos, pushing updated code to the user's personal repository, using separate commits for each task, and submitting videos, updated code, and exported chat history under Lab-4.

Assistant

Identified the four project tasks as: (1) fix winner evaluation; (2) implement first-to-five match, winner screen, and restart; (3) adapt CPU choices to recent player move patterns; and (4) add procedural move icons and a reveal animation.

User

Asked how to run the project.

Assistant

Provided Windows/VS Code steps: extract the ZIP, open the folder, open Terminal → New Terminal, check Python with python --version or py --version, install dependencies with python -m pip install -r requirements.txt, and run python main.py if that file exists.

User

Asked which output should be recorded.

Assistant

Explained that two 10-second recordings are required: a Before video showing the original game and an After video showing the updated game. Suggested Windows + Alt + R to record with Xbox Game Bar.

User

Shared a screenshot of the running Rock Paper Scissors — Adaptive Duel game.

Assistant

Confirmed that the screenshot shows the updated game's interface, including the score, first-to-five label, move buttons, and adaptive-play message. Recommended recording it as After_Changes.mp4 after testing the features.

User

Asked what to do about the Before video.

Assistant

Explained how to download/extract the original assigned repository into a separate folder and run the original version without overwriting the updated project. If the original code is broken, record its behavior before fixing it.

User

Asked for the command to run the Before version.

Assistant

Suggested checking the original folder, installing dependencies with python -m pip install -r requirements.txt, and running python main.py if present, or python app.py if that is the actual entry file.

User

Said the setup was done.

Assistant

Asked the user to confirm whether Before and After videos were recorded and whether updated code had been pushed to GitHub.

User

Reported: Before video recorded; After video recorded; updated code not yet pushed.

Assistant

Guided the user to open the updated project in VS Code, check git status, inspect git log --oneline -5 and git remote -v, avoid pushing to SETAPESU26, create genuine separate commits for each task, and push to the user's personal repository.

User

Asked for a complete ZIP to upload or submit.

Assistant

Provided a submission ZIP and explained that the actual videos and complete conversation export still needed to be added before final submission.

User

Asked how to get chat history.

Assistant

Explained how to save the conversation as a PDF using Chrome's Ctrl+P → Save as PDF, and also mentioned ChatGPT Settings → Data Controls → Export Data for an official account data export.

User

Asked the assistant to provide the chat history directly.

Assistant

Prepared this project-related conversation transcript as a PDF.

Submission reminder: add the user's actual Before_Changes.mp4 and After_Changes.mp4 recordings, updated source code, and any required evidence of separate commits. Confirm the code works before submitting.
