LAB 4 — VIBECODING PROMPT LOG

Rock Paper Scissor

Task 1 — Fix inverted outcome evaluation

Prompt

Inspect game/game_engine.py and correct the winner logic. Rock must beat Scissors, Scissors must beat Paper, Paper must beat Rock, and identical choices must be a draw. Provide a test matrix for all nine combinations.

Review checklist

Test all nine combinations; verify only the winner receives a point and draws do not change scores.

Task 2 — First-to-X match state

Prompt

Add a first-to-five match state. When either side reaches five points, stop accepting moves, display the match winner and final score, and tell the player to press R to reset. Reset both scores and round state.

Review checklist

Verify match ends at five, clicks are ignored after game over, and R fully resets.

Task 3 — Adaptive CPU pattern tracking

Prompt

Track a bounded history of recent player moves. When one move is repeated frequently, bias the CPU toward its counter-move while retaining randomness. Explain the heuristic and insufficient-history behaviour.

Review checklist

Verify early rounds remain random, history is bounded, and a clear repeated preference increases counter-move selection.

Task 4 — Procedural icons and reveal animation

Prompt

Replace plain-text-only move displays with procedural Pygame geometry for rock, paper, and scissors. Add a brief synchronized shake/countdown reveal before showing the result. Preserve 1.8-second result display and keep event processing responsive.

Review checklist

Verify all icons render, animation is time-based, close remains responsive, and result timing is preserved.

Final review

Prompt

Review the project against all README tasks. Identify defects, check scoring and match-state transitions, restart behaviour, adaptive heuristic, and provide a manual test checklist. Do not claim tests passed unless they were actually run.

Review checklist

Run the application and record the outcomes of each manual test.

Git commit plan

```
git add game/game_engine.py
git commit -m "Fix rock paper scissors winner evaluation"
# implement and test Task 2, then commit separately
git add game/game_engine.py
git commit -m "Add first-to-five match victory state"
# repeat separately for Tasks 3 and 4
```

This is a prepared prompt log. It is not the complete exported ChatGPT conversation. Export the actual conversation separately for the required deliverable.
